Winnebago System Walleye Telemetry Project, 2011

April 2011 – Surgically implanted 100 sonic tags in walleye sampled throughout the Winnebago System

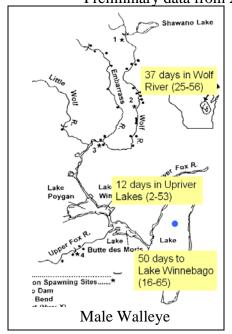

These fish were all marked with a secondary "streamer tag", and we ask that you please release these fish if you catch one.

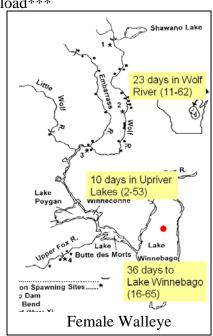

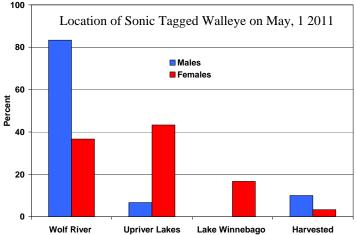

General trends that were observed from first year of movement (Note: trends based on preliminary data):

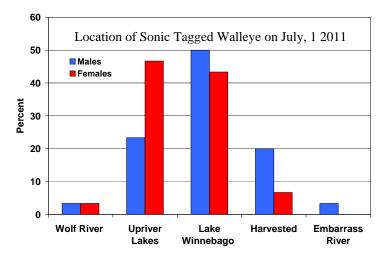

- ➤ Males reside in Upper Fox and Wolf Rivers ~14 days longer than females
- ➤ Very little movement between water bodies occurs after July 1
- Many walleye reside in Upriver Lakes throughout the summer
- Female walleye will spawn in Lake Puckaway (at least during springs with high water)
- Next two years of data will allow us to gain more insight into year round movement patterns
